

RENmaxdetection 0.0229; no cell type carries >1 step
 AGT → AGTR1 is not an edge (substrate, not ligand); tested as a control: $\rho = +0.01$, n.s.
 AGTR1 abundance is not AT1R activity: count model beta -0.07 against a matched-null centre of +0.08 (p_emp 0.001)
 matrix balance BM - fibrillar: beta -0.51 against its matched null (p_emp 0.001); donor $\rho = -0.31$
 the counter-regulatory arm does not oppose the response: pericyte ACE2 → response $\rho = +0.30^*$, against its prior sign

interaction LRT P = 0.505, n = 89 donors

n = 66-97 donors per edge
